IMPIEGO

I plug-fans sono realizzati per le applicazioni in cui le limitazioni di spazio richiedono strutture compatte ovunque sia necessario movimentare grandi quantità d'aria (pulita o leggermente polverosa) con basse pressioni all'interno di forni, cabine, plenum. Questa serie di ventilatori utilizza giranti a **pale curve rovesce** caratterizzate da un elevato rendimento. Sono forniti senza cassa e dotati su richiesta di una piastra coibentata e ventolina di raffreddamento per le applicazioni con aria calda. Le esecuzioni disponibili prevedono l'accoppiamento diretto (4 e 5) e l'accoppiamento con cinghie in sistemazione 13.

CARATTERISTICHE

Tutte le caratteristiche riportate sui diagrammi sono riferite ad aria alla temperatura di 15 °C e alla pressione barometrica di 760 mm di mercurio (peso specifico 1,226 kgf/m³).

RUMOROSITA'

I valori di pressione sonora riportati sui diagrammi sono ottenuti mediante le letture eseguite ad una distanza di metri 1,5 attorno al ventilatore. I dB riportati in catalogo si riferiscono alla scala "A", al massimo rendimento, con motore e trasmissione esclusi. Le letture sono state eseguite in campo libero con i ventilatori collegati alla tubazione in aspirazione secondo le norme UNI.

USE

Plug fans are designed for use where a space saving is required in every application for moving of large volumes of (proper or lightly dust laden) air with low pressure inside ovens, booths, plenums. This series of fans uses impellers with **backward curved blades** which have an high efficiency. They are supplied without casing and provided on request of an insulated plug panel and a cooling disk for use with hot air. Direct driven arrangement (4 and 5) and belt driven arrangement 13 are available.

SPECIFICATIONS

All specifications listed in the tables are referred to the air temperature of 15°C and the pressure of 760 mm mercury column, specific gravity 1.226 kgf/m³.

NOISE LEVEL

Noise level values given in the diagrams should be read at a distance of 1,5 m around the fan. The noise data mentioned in the catalogue are referred to scale "A", at maximum efficiency, motor and transmission belt noise are excluded. The readings took place in open field with pipe connection, according to UNI standard.

Rif. disegno n. 2
 Ref. drawing no. 2

I collaudi aeraulici sono stati eseguiti in campo libero con tubazione di collegamento in aspirante secondo la norma UNI 10531
 Il valore della distanza B è pari al valore minimo riportato nella tabella 1
 The aeraulic tests have been made in free-field with duct on suction side as per UNI 10531 standard.
 The value of distance B is identical to minimum value as indicated in table 1.

MISURA DI PORTATA VOLUMETRICA

I ventilatori appartenenti alle serie PFB PFM possono essere dotati di una o più prese di pressione sul boccaglio aspirante.

Connettendo le prese di pressione al flussometro FRF è possibile misurare o monitorare il valore della portata di fluido che attraversa il ventilatore.

Lo strumento FRF è dotato di un sensore di pressione, di un sensore di temperatura e di un sensore integrato di pressione barometrica tramite i quali è possibile misurare la portata anche al variare delle temperatura del fluido e della pressione barometrica.

Al momento dell'installazione è necessario soltanto inserire nello strumento il fattore K che dipende dalla serie di appartenenza e dalla grandezza del ventilatore.

I valori del fattore K sono riportati nella tabella successiva.

La formula con la quale si determina la portata è la seguente:

$$Q = K \cdot \sqrt{(2/\rho) \cdot \Delta p}$$

Dove:

Q = portata volumica (m^3/h) ρ = densità del fluido (Kg/m^3)
K = fattore K di flusso ($\text{m}^2\text{s}/\text{h}$) Δp = differenza di pressione (Pa)

Affinché il valore letto sullo strumento non risulti falsato, è fondamentale che la differenza di pressione Δp venga misurata tra le prese di pressione appositamente create sul boccaglio e un punto dell'ambiente di aspirazione in cui la misura della pressione statica non è influenzata dalla pressione dinamica.

AIR FLOW MEASUREMENT

PFB and PFM plug fans could be provided of pressure plugs on the inlet cone.

Connecting the pressure plugs to the FRF flow meter it is possible to take a measure or monitoring the air flow through the fan.

The FRF flow meter has a pressure sensor, a temperature sensor and an integrated barometric sensor allowing to measure the air flow even if the air temperature and barometric pressure change.

Only a definition of the type of the fan (K-factor) is necessary at the installation.

The K-factor values are in the given table.

The air flow is calculated with the following formula:

$$Q = K \cdot \sqrt{(2/\rho) \cdot \Delta p}$$

Where:

Q = air flow volume (m^3/h) ρ = air density (Kg/m^3)
K = K-factor flow ($\text{m}^2\text{s}/\text{h}$) Δp = differential pressure (Pa)

In order to avoid wrong readings on the air flow measure the Δp differential pressure should be taken between the pressure plugs on the inlet cone and a point of the room where the static pressure is not affected by air velocity (dynamic pressure).

A decorative background featuring a light gray world map silhouette and a pattern of small gray dots scattered across the page. The map is centered and shows the outlines of the continents. The dots are of varying sizes and are distributed across the entire page, creating a subtle, textured effect.
